

XBOT EV | PRODUCT LAUNCH

TASK 2 SUBMISSION | FINAL SCRIPT + SHORT CASE STUDY

Runtime	19.03 seconds	Format	9:16 vertical
Resolution	720 x 1280	Delivery	H.264 MP4 + AAC
Creative style	Premium / futuristic	Voice-over	None - music-led

Final Script

00:00-00:03 LAUNCH COUNTDOWN	Dramatic 3-2-1 countdown. On-screen: THE FUTURE HAS ARRIVED.
00:03-00:06.2 PRODUCT INTRODUCTION	Rapid multi-angle views establish the bike. On-screen: PREMIUM / FUTURISTIC / INTELLIGENT
00:06.1-00:08.8 FRONT REVEAL	Front view highlights lighting and bodywork. On-screen: TOMORROW TAKES SHAPE.
00:08.7-00:11.3 PROFILE REVEAL	Full side profile presents silhouette and proportions. On-screen: MEET XBOT EV.
00:11.18-00:13.58 DESIGN SHOWCASE	Unobstructed three-quarter view. On-screen: DESIGNED FROM EVERY ANGLE SCULPTED. BALANCED. UNMISTAKABLE.
00:13.46-00:16.26 INTELLIGENT DASHBOARD	Centered cockpit view highlights the digital interface. On-screen: INTELLIGENT CONTROL CLARITY AT A GLANCE
00:16.14-00:19.03 BRAND FINALE	XBOT EV logo and hero close. On-screen: SMARTER MOBILITY. STRONGER FUTURE.

Creative intent

Introduce XBOT EV through a concise reveal structure: anticipation, design, intelligent control and brand promise. The advertisement intentionally avoids unsupported claims about speed, range, charging time, price, emissions or safety.

Short Case Study

A MOBILE-FIRST, AI-GENERATED PRODUCT LAUNCH

Project objective

Create a premium 15-20 second launch advertisement for XBOT EV using AI-generated footage. The video needed to communicate a futuristic, intelligent identity while remaining suitable for mobile-first marketing.

Creative strategy

The film uses a focused launch structure: countdown, product reveal, design showcase, intelligent dashboard and brand close. The opening creates anticipation, the full-bike views establish the product, and the dashboard introduces the intelligent-mobility message. The finale reinforces the brand line, Smarter Mobility. Stronger Future.

Production approach

AI-generated source clips were edited into a unified 9:16 sequence. Two weaker wide-format scenes were rebuilt for the final version. Empty side panels were removed without cropping the bike or dashboard. Layered blue backgrounds, improved contrast, controlled timing, refined typography, short crossfades and a synchronized electronic soundtrack created a consistent launch-film aesthetic.

Quality and governance

The master was checked for scene order, complete product visibility, readable typography, smooth transitions, duration, aspect ratio, frame rate, audio and playback compatibility. Marketing language was restricted to the supplied brand direction. Unsupported specifications and performance claims were excluded.

Tools and cost

AI video-generation tools produced the source footage. FFmpeg was used for reframing, colour treatment, timing, transitions, audio synchronization and final encoding. Free generation credits and locally available editing tools were used; no paid editing cost was required.

Final output

The final advertisement is 19.03 seconds, 720 x 1280, 9:16 vertical and 30 fps, with H.264 Main Profile video and stereo AAC audio. It satisfies the required 15-20 second runtime and is optimized for reliable playback on browsers, Windows, Android and common social platforms.

Organisational value

The result gives XBOT EV a reusable mobile-first launch asset for Instagram Reels, TikTok, YouTube Shorts, WhatsApp and paid social campaigns. Its modular structure allows individual scenes or messages to be updated without rebuilding the entire advertisement.

Limitation

No live campaign data was available, so awareness, engagement and conversion improvements are intended outcomes rather than measured results. Production use should confirm final product specifications and obtain approval for all marketing claims.
